Assignment 3
Due a week from today

grades by the end of the week

questions?

Data Driven Design cont.

2D Data: Images & Maps

GIS, tip of the iceberg

PHOTOGRAPH

GIS

A geographic information system (GIS) is a computer system for capturing, storing, checking, and displaying data related to positions on Earth's surface. GIS can show many different kinds of data on one map, such as streets, buildings, and vegetation. This enables people to more easily see, analyze, and understand patterns and relationships.

GOVERNMENT ACCOUNTABILITY OFFICE

GIS, tip of the iceberg

- GIS = Geographic Information System
Data may include:
 - GPS locations
 - 3D models of buildings and other structures
 - Environmental data
 - Topographical/elevation data
 - etc.
- Tons of available open data: <https://apps.nationalmap.gov/>
- Open source GIS software, QGIS: <https://www.qgis.org/en/site/>

Example Workflow

- Download a GeoTIFF from: <https://apps.nationalmap.gov/>
- Use QGIS to convert GeoTIFF to an image. Import the GeoTIFF as a new layer in a project. Then go to Project—>Export Map as Image to copy or save the image
- Use Photoshop to convert th3 image to a bitmap (.bmp or .pnm)
- Import bitmap into GH/Rhino to map pixel data to 3D printable geometry

Browser

- /Volumes
- Favorites
- Spatial Bookmarks
- Home
- / (Macintosh HD)
- GeoPackage
- SpatialLite
- PostgreSQL
- SAP HANA
- MS SQL Server
- Oracle
- WMS/WMTS
- Vector Tiles
- XYZ Tiles
- WCS
- WFS / OGC API - F
- ArcGIS REST Serve

Layers

- USGS_1_n36
- Band 1 (Gray)
- 3,418.6843
- 1,499.447266

Save Map as Image

South

Calculate from

Scale

Resolution

Output width

Output height

Draw active decorations: none

Draw annotations

Append georeference information (embedded or via world file)

Sandia mountains GeoTIFF

Bitmaps in GH and Rhino

Step 1: what I messed up in class:
installing the **human** GH plugin

Install the human GH plugin

- **IMPORTANT:** must follow these exact steps to install the correct version of the library. Do not install the Food4Rhino version.
- In Rhino, open the Package Manager by typing "Package Manager" in the command line.
- Choose "human" v1.3.1 in the box that pops up and click Apply.
- Quit and restart Rhino.

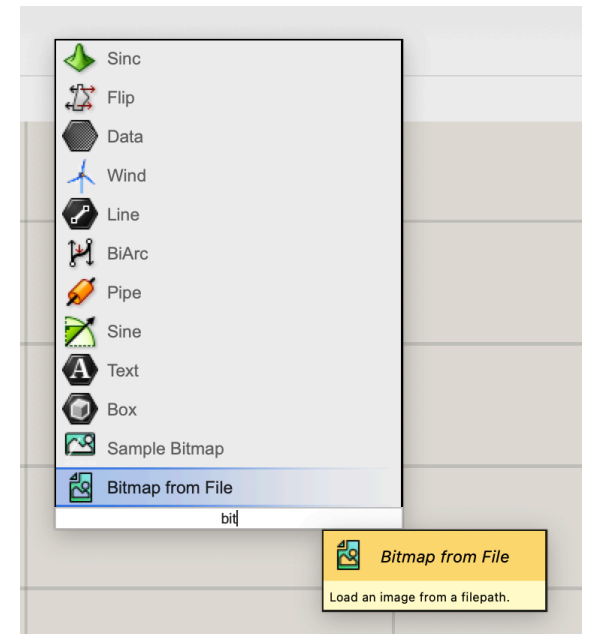

Open the bitmap in GH

specify path

```
1 import rhinoscriptsyntax as rs
2
3 filter = "IMG file (*.bmp)|*.pbm|*.png|All Files (*.*)|*.*|*"
4 file = rs.OpenFileName("Open Image File", filter)
```

open bitmap block
(requires human plugin)

Create point arrays

The 1D array creates a list of points in the range 0-1. This will be used to access pixel information.

```
1 import rhinoscriptsyntax as rs
2
3 array2D = []
4 array1D = []
5 for i in range(0,w,10):
6     row = []
7     for j in range(0,h,10):
8         row.append(rs.CreatePoint(i,j,0))
9         array1D.append(rs.CreatePoint(i/float(w),j/float(h),0))
10    array2D.append(row)
```

The 2D array creates an array of points in that correspond to the size of the bitmap. This will be used to create the final geometry.

Create point arrays

Important: make sure you are incrementing the i and j variables by 10. Otherwise your program will generate too many points and run very very slowly.

```
1 import rhinoscriptsyntax as rs
2
3 array2D = []
4 array1D = []
5 for i in range (0,w,10):
6     row = []
7     for j in range (0,h,10):
8         row.append(rs.CreatePoint(i,j,0))
9         array1D.append(rs.CreatePoint(i/float(w),j/float(h),0))
10    array2D.append(row)
```

Get pixel information using Sample Bitmap

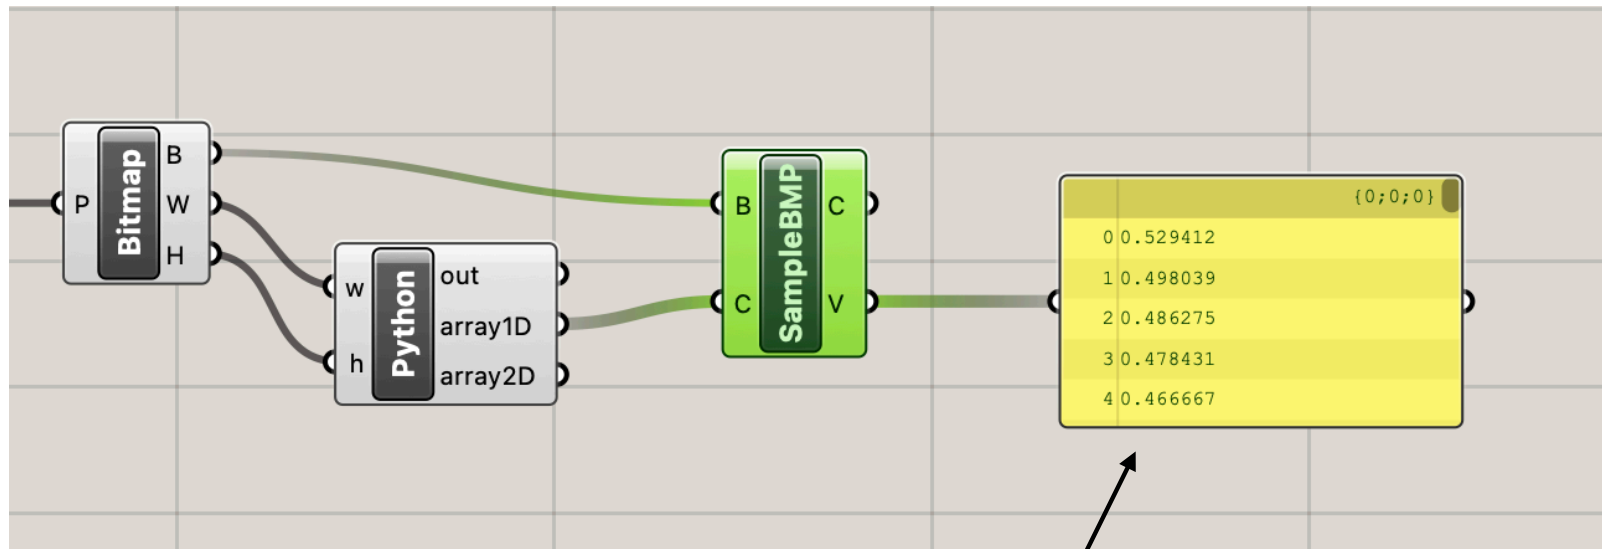

returns pixel color (C) and
brightness (V) information

B input = bitmap

C input = point/pixel index
(in range of 0-1)

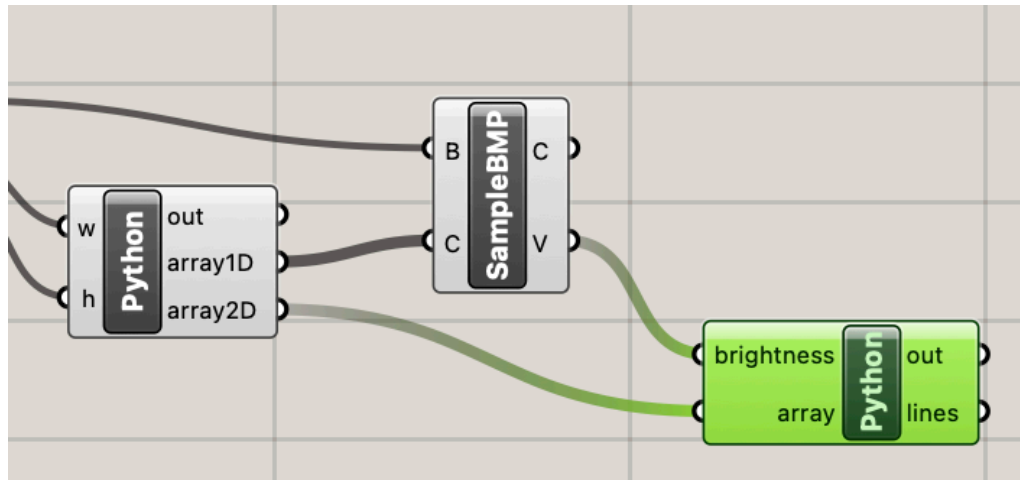

Get pixel information

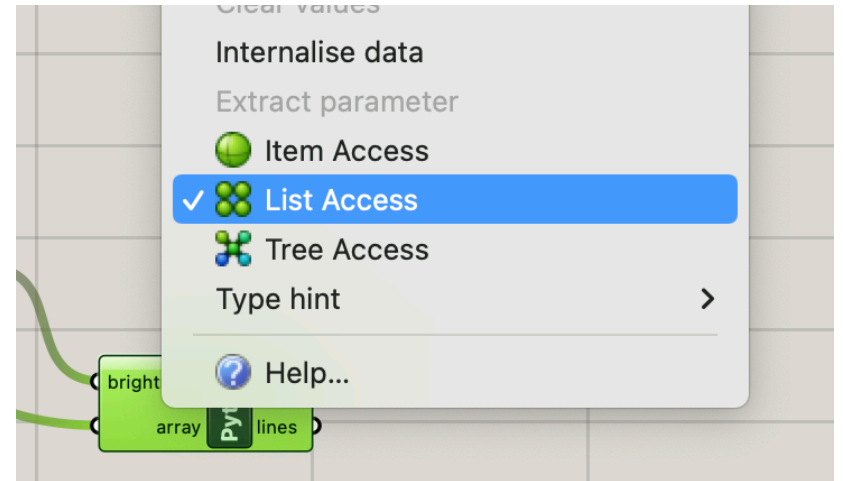

brightness of each pixel
note: just using a yellow Panel
text box to look at the data.

Generate geometry from pixel info

Important: List Access vs. Item Access

connect 2D array & brightness info to new python block

choose list access for both inputs
also set correct Type hints
brightness: float
array: Point

Brightness = z component of new point

```
1 import rhinoscriptsyntax as rs
2
3 lines = []
4
5 b = 0
6 for i in range (0,len(array)):
7     points = []
8     for j in range (0,len(array[i])):
9         point = rs.CreatePoint(array[i][j].X, array[i][j].Y, brightness[b]*500)
10        points.append(point)
11        b = b+1
12    line = rs.AddCurve(points)
13    lines.append(line)
```

add a multiplier to z component
(here 500) to get a more
dramatic effect

Array of points for each image row

```
1 import rhinoscriptsyntax as rs
2
3 lines = []
4
5 b = 0
6 for i in range (0,len(array)):
7     points = []
8     for j in range (0,len(array[i])):
9         point = rs.CreatePoint(array[i][j].X, array[i][j].Y, brightness[b]*500)
10        points.append(point)
```

Line for each image row

```
1 import rhinoscriptsyntax as rs
2
3 lines = []
4
5 b = 0
6 for i in range (0,len(array)):
7     points = []
8     for j in range (0,len(array[i])):
9         point = rs.CreatePoint(array[i][j].X, array[i][j].Y, brightness[b]*500)
10        points.append(point)
11        b = b+1
12    line = rs.AddCurve(points)
```

Array of lines is final output

```
1 import rhinoscriptsyntax as rs
2
3 lines = []
4
5 b = 0
6 for i in range (0,len(array)):
7     points = []
8     for j in range (0,len(array[i])):
9         point = rs.CreatePoint(array[i][j].X, array[i][j].Y, brightness[b]*500)
10        points.append(point)
11        b = b+1
12    line = rs.AddCurve(points)
13    lines.append(line)
```

Array of lines is final output

Loft to create surface from lines

questions?

Thank you!
